

Updates this week:

- Kofi: jenkins integration (still has some issues to work through)
- Josh: database, UML generated by mySQL
- We have a full readme for environment setup now.

Questions for TA meeting:

- Jenkins: permissions (for slack integration), how to get the junit xml
- Masscloud: instance is running, real IP, unclear how to get into it.

Things to look into / for the future:

- Jira / git comment integration?
- Hooking java to the database
- Ani / Aasish: starting on front end. Bootstrap 4, HTML5, angularJS
- ORMLite connector, Create repository base class
- Respond to the client / show prototypes when possible
- Restructuring files but still having Jenkins work? (with more nested folders)
- Jenkins building only when master is committed? (is it possible)

Accomplished during this meeting:

- Bring database script branch into master. (review and pull)

To do for the future (before 11/3 TA meeting):

- Aasish: sequence diagram, use cases
- Start front end a little

For next Tuesday meeting: get our code on a projector and actually review it.
